FINAL EXAMINATION

TRIMESTER 2, 2022/2023

BFN3164 – FINANCIAL RISK MANAGEMENT

(All sections / Groups)

10 July 2023
9:00 a.m. – 11:00 a.m.
(2 Hours)

INSTRUCTIONS TO STUDENTS

1. This question paper consists of **9 pages, including the cover page**
2. Answer **all three** questions.
2. Please provide your answers in the Answer Booklet.
3. Mark distributions are shown in the given templates.

QUESTION 1 (25 MARKS)

Given the following information of a call option:

Stock Price (S_0)	28
Exercise Price (K)	18
Risk free rate (r_f)	5%
Maturity (T) (Weeks)	10
Standard deviation (s)	0.2
Number of options	10,000

Stock price in the following week of this call option is RM18.

You are required to compute:

a. Price of the call option.

(10 marks)

b. The number of shares needed for delta hedge and the total cost of purchasing these shares, in the first two weeks.

(15 marks)

QUESTION 2 (25 MARKS)

A US firm, named APPLE, has agreed to sell £ 1 million to a UK firm, named ORANGE for $1.25 in 1 year. The following is the market conditions:

Interest rate in the U.S.	4%
Interest rate in the U.K.	6%
Forward rate ($/£)	1.226
Sport rate ($/£)	1.250

a. Please design money market hedge strategy for APPLE so that the company will be able to honor its contract with ORANGE.

(12.5 marks)

b. Please design a money market hedge strategy for ORANGE so that the company will be able to honor its contract with APPLE.

(12.5 marks)

Continued...

QUESTION 3 (25 MARKS)

Given the confidence level of 98%, there are three independent projects. The loss distribution for individual projects is given below.

Probability	Loss (RM million)
0.01	20
0.99	4

a. What is the VaR for one of the projects at the assigned confidence level?

(5 marks)

b. What is the expected shortfall for one of the projects at the assigned confidence level?

c.

(5 marks)

d. What is the VaR for a portfolio consisting of the three projects at the assigned confidence level?

(5 marks)

e. What is the expected shortfall for a portfolio consisting of the three projects at the assigned confidence level?

(5 marks)

f. Show that in this example VaR does not satisfy the subadditivity condition whereas expected shortfall does.

(5 marks)

QUESTION 4 (25 MARKS)

Explain the difference between risk decomposition and risk aggregation. When would it best to use each of these methods for a firm? Please give an example to elaborate your argument.

End of Question

Appendix: Formula for Black Scholes Option Pricing Model

$$C = S.N(d_1) - Ke^{-rt}.N(d_2)$$

$$d_1 = \frac{ln(S/K) + [r + (\sigma^2/2)]T}{\sigma\sqrt{T}}$$

$$d_2 = d_1 - \sigma\sqrt{T}$$

where

S	=	spot price of underlying asset
K	=	exercise price of call option
T	=	time to expiration (as % of year)
r	=	rf interest rate
e^{rt}	=	exponential function of rf and T
$N(.)$	=	cumulative standard normal distribution function
σ	=	volatility of underlying asset as measured by standard deviation
$ln\ (S/K)$	=	natural logarithm of S/K

$$N(d_2) = N(d_1 - \sigma\sqrt{T})$$

$$N'(d_1) = e^{\left[\frac{-(d_1)^2}{2}\right]} \frac{1}{\sqrt{2\pi}}$$

Table for $N(x)$ When $x \geq 0$

This table shows values of $N(x)$ for $x \geq 0$. The table should be used with interpolation. For example, $N(0.6278) = N(0.62) + 0.78[N(0.63) - N(0.62)] = 0.7324 + 0.78 \times (0.7357 - 0.7324) = 0.7350$.
